I’m not a traditional software engineer. I’m older, with a seemingly disparate background that includes twenty years as a mother and home educator, and a successful return to my bachelor’s in an entirely new field of computer science.

But that's exactly why you want to hire me to work at NerdFarm.

To explain, let me tell you a story:

Once upon a time, a teenage girl fell in love with Latin.

This is where everything started. Everything that followed until now grew from that moment.

The girl studied the language voraciously for five years before graduating and heading to college.

She spent three years working towards becoming a Latin teacher, loving every minute of studying the classical world. Her favorite part was decoding real Latin texts, from Virgil to Cicero to Caesar. The language was always a puzzle waiting to be teased apart and understood. She became an expert at finding the patterns in the words she loved.

However, she also loved her high school sweetheart and married him before her fourth year. Becoming pregnant was bittersweet: she joyfully looked forward to growing and nurturing her family, but had to set aside her degree for a time.

But those years immersed in Latin and education still lived within her. She homeschooled her children, teaching them to love learning as much as she did. This kept her mind active and constantly learning. She even dipped her toe into programming and spent too much time playing with various code education platforms.

Originally, she always planned to finish her Latin degree. However, that dream slowly evolved as she learned programming. In 2017, she made the leap from a supposedly dead language to the very much alive field of software engineering. She returned to college part-time and completed her degree in 2023.

Studying software engineering was as exciting as studying Latin. Programming wasn’t very different from classical languages, except for the absolute magic of creating something wholly new from your work. She successfully turned her skills in translating ancient texts into understanding various programming languages and structures. Since databases were a logical system, they quickly became her favorite subject as she learned SQL and PHP. When she began a new project, she methodically studied the related systems and documentation.She also grew to like JavaScript, proving that repeated exposure can make anything enjoyable. And when she graduated, she realized how much more she had to learn in her new field. It was a daunting but exciting prospect.

I was this girl who loved Latin and became the woman who loves programming. My varied experiences are the foundation for my current competence. Unhindered by my circumstances, I push forward towards my next adventure; I want to learn everything I don't know yet. I want to work for NerdFarm because, in part, I am impressed by NerdFarm's LibreSRD. Systems carefully organized and cross-referenced are a joy to work with. More importantly, I want to help build ConfirmedCritical into a flexible yet comprehensive RPG management system.
